

Pillar 3 / Iter 119 -- Cross-pillar inversion (P2 x P3), retention extrapolation, Wu boundary, per-step variance

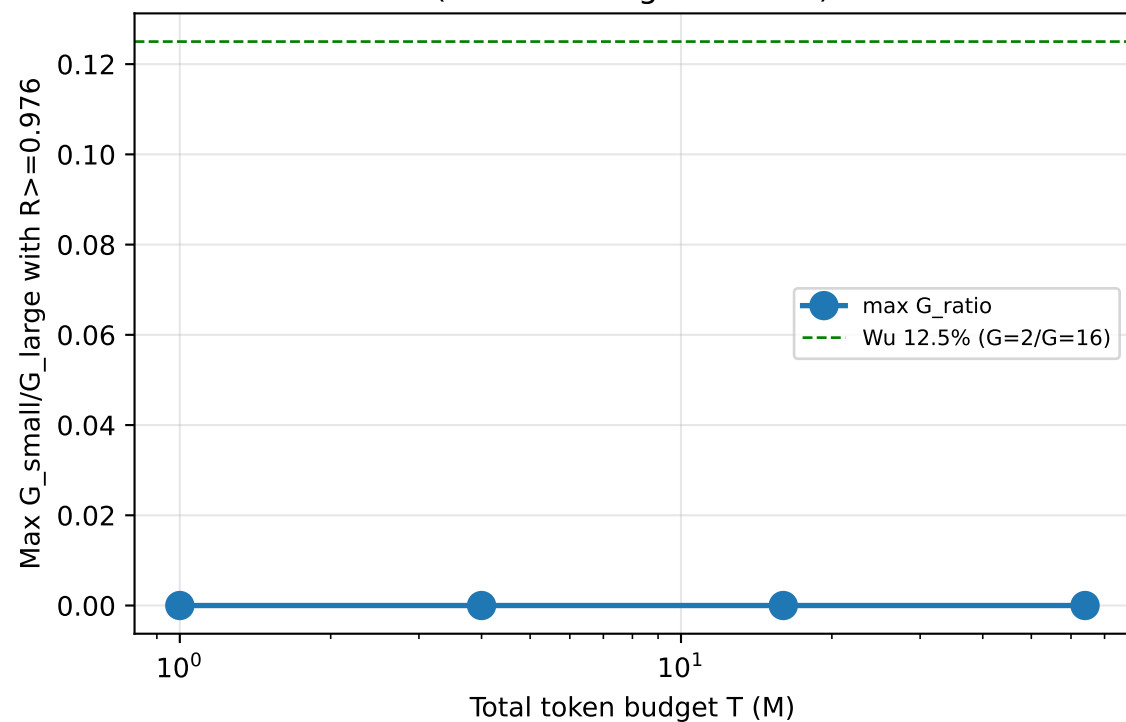

(A) Retention vs log(T):linear decay, slope=-0.138/decade

(B) Cross-pillar: $\rho(\text{ZVF}, \text{last10})=+0.202$
NEGATIVE rho => more contrast -> drift (P2+P3 unification)

(C) Wu-equivalence boundary collapses with T
(rollouts-budget frontier)

(D) At $G=8$: $\sigma^2/G = 0.0220$
